Day 3 - API Integration Report –Elite Bazaar

In the documentation, I have referred to the project as **Elite-Bazaar**, representing Template 5 of the E-commerce Store.

Submitted By: Liaqat Khan

GIAIC Student

Expected Deliverables:

1. Setting up Sanity:

- ➤ Initialized Sanity with npm create sanity@latest.
- > Added necessary CORS origin (http://localhost:3000) and generated an API token.

2. Environment Variable Configuration:

> Added API token to the .env file.

3. Schema Creation:

Created product.ts schema in schemaTypes with appropriate fields: name, description, price, and image.

4. Data Import Script:

- Created a scripts/importData.js file with a script to fetch and import data using Sanity Client and Axios.
- Configured dotenv for API tokens and credentials.

5. Dependencies Installation:

➤ Installed required dependencies: @sanity/client, axios, and dotenv.

6. Package Script Updates:

- > Added "import-data": "node scripts/importData.js" to package.json.
- ➤ Added "type": "module" to package.json if needed.

7. Data Import Execution:

➤ Ran the script with npm run import-data to import data into Sanity.

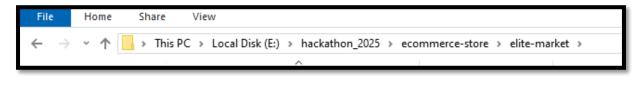

8. Testing UI:

Verified cart functionality, such as adding items to the cart, viewing the cart summary, and checking product data display in the UI.

Configuring and Integrating Sanity with Elite-Bazaar

Step 1: Open the Project Director

➤ Navigate to **This PC** and locate your project folder: ecommerce-store (consider as **Elite-Bazaar**).

Step 2: Initialize Sanity in the Project

- > Open the project directory in the terminal or Command Prompt.
- Run the following command to create a new Sanity configuration: npm create sanity@latest

```
E:\uiux-hackathon\ecommerce-store>npm create sanity@latest
Need to install the following packages:
create-sanity@3.70.0
Ok to proceed? (y) y
```

After successful execution, you will see:
"Success! Your Sanity configuration files have been added to this project."

```
Run `npm audit` for details.

Success! Your Sanity configuration files has been added to this project npm notice

npm notice New major version of npm available! 10.9.0 -> 11.0.0

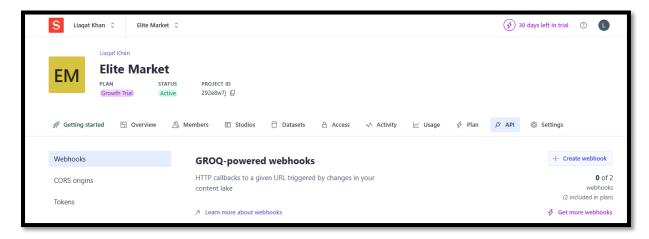

npm notice Changelog: https://github.com/npm/cli/releases/tag/v11.0.0

npm notice To update run: npm install -g npm@11.0.0

npm notice
```

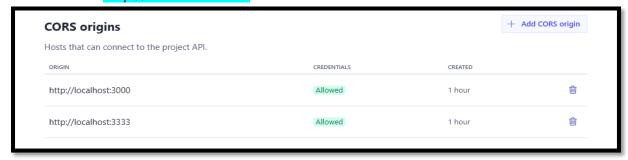

Step 3: Configure API Settings

- Open your Sanity dashboard.
- > Go to the **API** section in your Sanity dashboard.

1. Add CORS Origin:

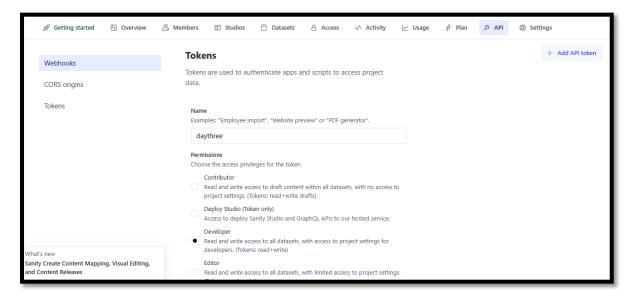

- If http://localhost:3000 is not already added, include it.
 - Navigate to the CORS settings, click Add Origin, and enter:
 - http://localhost:3000

2. Generate API Token:

- Click Add API Token and configure the following:
 - > **Name**: Enter a descriptive name (e.g., "daythree", "Development Token", etc).

- > Permissions: Set to Developer.
- Click **Save** to generate the token.

Step 4: Secure the API Token

1. Copy the generated token.

2. Open the .env file in your project and add the token:

SANITY_API_TOKEN=your-api-token

Step 5: Create the product.ts Schema

In the project directory, navigate to:
 E:\uiux-hackathon\ecommerce-store\src\sanity\schemaTypes

- 2. Create a new file named product.ts.
- 3. Add Code

```

                                            validation: (rule) => rule.required(),
                                            title: "Price",
      ↔ tsconfig.json
      > OUTLINE
       TIMELINE
```

Step 6: Create and Configure Data Import Script

- In the project directory, create a folder named script
- Inside the script folder, create a new file: importData.js.
- Add the script Code.

```
🗙 File Edit Selection View Go Run …
                                                                             P ecommerce-store
                          us importData.js U X
     import { createClient } from "@sanity/client";
      node_modules
                                 const client = createClient({
     m public
                                 projectId: """,
     script
                                  dataset: "production",
       importData.js
                                  useCdn: true,
                                  apiVersion: "2025-01-13",
      # .env.local
                                  token:
      eslintrc.json
      .gitignore
      next-env.d.ts
                                 async function uploadImageToSanity(imageUrl) {
      next.config.mjs
      package-lock.json M
                                     console.log(`Uploading image: ${imageUrl}`);
      package.json M
                                     const response = await fetch(imageUrl);
      postcss.config.mjs
                                     if (!response.ok) {
      README.md
                                       throw new Error(`Failed to fetch image: ${imageUrl}`);
      sanity.cli.ts
      sanity.config.ts
      tailwind.config.ts
                                     const buffer = await response.arrayBuffer();
      ↔ tsconfig.json
                                     const bufferImage = Buffer.from(buffer);
                                     const asset = await client.assets.upload("image", bufferImage, {
                                       filename: imageUrl.split("/").pop(),
                                     console.log(`Image uploaded successfully: ${asset._id}`);
囟
                                     return asset._id;
                                   } catch (error) {
                                     console.error("Failed to upload image:", imageUrl, error);
     > OUTLINE
```

Step 7: Install Required Dependencies

Run the following command to install the required packages:
 npm install @sanity/client axios dotenv

```
E:\hackathon_2025\ecommerce-store\elite-market>npm install @sanity/client axios dotenv

added 12 packages, removed 7 packages, changed 4 packages, and audited 1305 packages in 17s

247 packages are looking for funding
   run `npm fund` for details

found 0 vulnerabilities

E:\hackathon_2025\ecommerce-store\elite-market>
```

Step 8: Modify package.json

- Line 5: Add "type": "module", if not already present.
- Line 11: Add the import script:
 "import-data": "node scripts/importData.js"

```

Step 10: Verify and Test

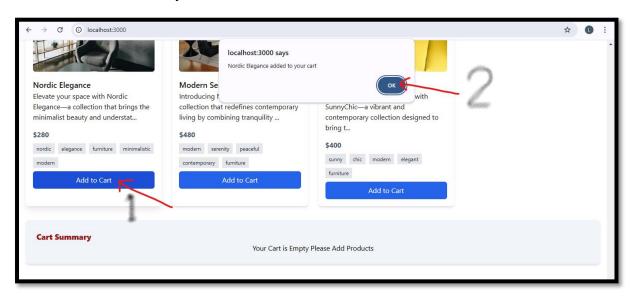

- Ensure the data is displayed in the Sanity Studio UI.
- Test the Cart functionality:
 - > Add items one by one to the cart.
 - > View the Cart Summary.

Cart is Empty

> Add items one by one to the cart

> View the **Cart Summary**.

Conclusion

The objectives for **Day 3** have been successfully achieved, with the seamless integration of the Sanity backend into the **Elite-Bazaar** project. All required configurations, including API setup, CORS configuration, token generation, schema creation, and data import, were implemented with precision. The project now features efficient data fetching and dynamic UI updates, meeting all specified requirements and ensuring a robust foundation for further development.

Acknowledgment

"A heartfelt thanks to my mentors, Sir Zia Khan, Sir Daniyal Nagori, Sir Ameen Alam, Sir Anas, Sir Ubaid Ur Rehman, and all our dedicated teachers and staff, for their guidance and support throughout this Hackathon journey. Your expertise and encouragement have been invaluable."
